

Beyond Tier Ratings: Where Are Kenya's Data-Centre Networks Concentrated?

A directory-led look at registered network presence and interconnection across selected Kenyan facilities.

REAL FACILITY · NAIROBI

DC254 DIRECTORY · FIELD VERIFIED

A Nairobi data-centre hall. The networks inside a facility are a recorded, checkable fact.

Certification, capacity and interconnection answer different questions

01 • Tier ratings

Describe specified design and operational characteristics of a facility.

02 • Capacity

Power, racks and site area show how much compute a location can hold.

03 • Interconnection

Networks on site and exchanges present show who is directly reachable.

Buyers need all three answers. A network count is not a tier rating, and neither is a megawatt.

The five most networked facilities in Kenya

01	122 NETS	Africa Data Centres Nairobi 1 (NBO1) Nairobi · 4 internet exchanges
02	94 NETS	iColo Mombasa One (MBA1) Mombasa · 3 internet exchanges · the international gateway
03	62 NETS	iColo Nairobi One (NBO1) Nairobi · 4 internet exchanges
04	44 NETS	iXAfrica NBOX1 Nairobi · 3 internet exchanges
05	40 NETS	iColo Mombasa Two (MBA2) Mombasa · 3 internet exchanges
06	37	PAIX Nairobi (NBO-1) · 3 internet exchanges · just outside the five

WHAT THE NUMBERS COUNT: unique networks registered at the facility in PeeringDB (network-reported). IXs = internet exchanges with a recorded presence on site.

The cluster and the gateway both rank

Mombasa brings the international routes. Nairobi concentrates networks, facilities and enterprise demand. **Network presence is one signal of concentration. It does not by itself settle strategic importance.**

What interconnection presence offers a customer

- 01** **Carrier choice** - reach multiple networks without new construction
- 02** **Exchange access** - direct on-site paths where KIXP, LINX and PLUGINS IX have a presence
- 03** **Cloud reach** - shorter routes toward cloud on-ramps and enterprise networks
- 04** **Local traffic** - traffic can stay local where peers are on site
- 05** **Redundancy** - options for diverse network paths in and out of the building

Interconnection is **checkable**. That is why DC254 records it, facility by facility.

What a network count does not tell you

Not traffic volume. A registered network may pass little or no traffic.

Not resilience or service quality. Presence says nothing about uptime or support.

Not commercial terms. Availability, pricing and access vary by tenant and network.

Presence is a signal of where the ecosystem is accumulating. **It is not a verdict on quality.**
